

Observed index Inferred terminal sequence Modeled route work

A. Cross-source departure collapse

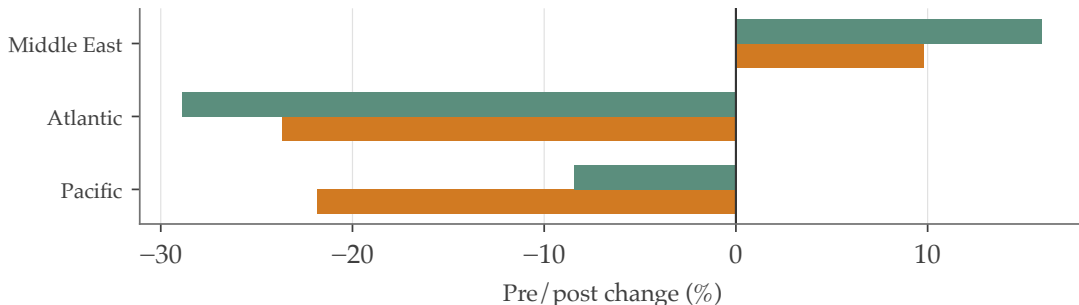

B. Count versus distance decomposition

C. Destination-basin composition

Nominal capacity (inferred) Capacity-distance (modeled)

Panels A and B share one scale and one zero line; panel C is a different cut and carries its own.

Country-level Hormuz-exposed changes are not estimable (post n = 2 overall) and are reported as a null, not plotted.

Observed aggregate index, inferred terminal sequences, and modeled routes are distinct evidence layers. No cargo quantity, sailed track, freight rate, or causal ATT is claimed.
