

(a) Source concentration

(b) Portfolio reshuffling

(c) Exploratory diagnostic

Panel (a) is signed and carries a zero line; panels (b) and (c) are non-negative magnitudes anchored at zero. Shading in panel (c) marks the conventional $|z| < 1.96$ region. All 6/6 units flag, empirical percentile 1.000 for each flagged unit, tail-p floor-censored at 1/13, so the flag separates no unit from another. Panel (c) is ordinal evidence only; no panel is a causal estimate.
